The invention relates to a vibration-damped tool holder. The problem which the invention is intended solve is to provide a more simple method to damp vibrations.

Document D1 represents closest background art.

## Claim 1

Document D1 (fig. 1) reveals a tool holder (1) for a machine tool comprising a shaft (2) and a head (3). The parts are joined together by an adhesive joint in form of a glued joint with vibration damping characteristics (claim 1). Adhesive materials in form of glues generally exhibit visco-elastic properties.

The invention differs from the document in that the document in that the visco-elastic material also comprises a bearer material.

A person skilled in the art faces the problem of providing a vibration damping material with an alternative design.

However, vibration damping material comprising several layers or a bearer material for the vibration damping layers as well as the use of such materials is well known to a person skilled in the art. A multilayer vibration damping material is exemplified in document D2.

Continuation of: BOX V

In background of this knowledge, it is considered obvious to a person skilled in the art to provide the tool holder in document D1 with a vibration damping material comprising a bearer material.

Consequently, the claim lacks inventive step.

**Claims 2-12**

The solutions according to claims 2-12 are, in background of what is known through documents D1 and D2 together with document D3 (showing a tool holder with a damped holder, fig. 2) and D4 (showing a tool holder with visco-elastic material in form of ring sections), only to be considered as solutions obvious to a person skilled in the art.

Therefore, claims 2-12 lack inventive step.

According to the arguments stated above, the invention according to claim 1-12 is novel but is not considered to involve an inventive step. The invention according to claims 1-12 is considered to be industrially applicable
